Sofia, Bulgaria · remote since 2019

I write the part that has to stay up. Shipping production software since 2019. Building in Rust since 2021. Accountant before that, which is where the habit of checking the number twice comes from.

From developer tools to data platforms.

Backend services, distributed protocols and the tools around them. Remote since 2019.

Apr 2025 – present — **Fathom** Senior Software Engineer — Remote, UAE
- Rust backend systems for an AI-driven data platform.
- Multi-workspace monorepo: services, storage, control plane.
- Transactional outbox and event relay, keeping database writes and event publication consistent.

Jul 2022 – Apr 2025 — **The Graph** Senior Rust Engineer · GraphOps — Remote
- At GraphOps, one of The Graph's core developer teams.
- Designed and built Graphcast, a P2P messaging protocol on Waku and libp2p.
- Backend services carrying the traffic, and a yew.rs frontend for the tooling.
- Delivered protocol demos and developer workshops.

Dec 2021 – Jul 2022 — **Kraken** Rust Engineer — Remote
- Developer tooling for testing exchange HTTP APIs.

Mar 2021 – Dec 2021 — **The Graph** Rust Engineer · LimeChain — Remote
- At LimeChain, a dev shop, on a Graph Foundation grant.
- Created Matchstick, the ecosystem's subgraph testing framework. Rust and WebAssembly.

Jan 2020 – Mar 2021 — **OVO Energy** Full Stack Engineer — Remote, UK
- Scheduling product for field engineer appointments. Kotlin and Quarkus microservices.
- Built the Flutter app from scratch, and the React web client beside it.

Jan 2019 – Jan 2020 — **WeiChain** Junior Software Engineer — Remote, Sofia
- Smart contracts on Ethereum and Aeternity.
- Shipped a decentralised exchange to mainnet, plus an atomic swap widget.

2019 — In production since 2019. Rust since 2021.

Building now, and shipped and still running.

nuthatch - a self-hosted blockchain indexer in Rust. Follows the chain, seals history into Parquet and serves SQL and MCP. `nuthatch-indexer.com`

redstart - a typed language for subgraphs. Emits schema, manifest and AssemblyScript mappings for the existing Graph toolchain. `redstart-lang.com`

yatr - a Rust task runner with content-addressed caching, optional native cache signing and REAPI HTTP cache support. `yetanothertaskrunner.com`

matchstick - a Rust and WebAssembly subgraph testing framework I created at LimeChain. Documented in The Graph's official tooling and invoked through graph test. `LimeChain for The Graph, on a Foundation grant, 2021`

graphcast and **subgraph-radio** - a P2P messaging protocol for The Graph's indexer network, built on Waku and libp2p. Gossip, fault-tolerant delivery, and a radio pattern that lets anyone add a message type without touching the core. `GraphOps, a Graph core dev team, 2022-2025`

The Night's Watch - the unglamorous half of The Graph: indexers, gateways, data services, judges and doctors. Lodestar, Dispatch, Foghorn, horizon-doctor, Graphite, and learn-thegraph.com. `github.com/nuthatch-org`

Where I can help.

In scope
- Rust backends, services and CLIs
- Distributed systems and P2P protocol work
- Blockchain indexing and data infrastructure
- Developer tooling, languages and testing frameworks
- Taking something that half works and making it hold
- Remote, EET, overlapping most of a European day

Working preferences
- Remote from Sofia, Bulgaria
- European working hours, with some US overlap
- Backend and infrastructure as the main responsibility
- Room to question a design and take ownership of the result
